

# SYNAPSE Study

**Do you have Parkinson's disease?**

**Have you noticed a decline in your memory or understanding?**

If so, you may be eligible for a research study.

## STUDY DETAILS

### **What is the goal of this study?**

The SYNAPSE study is looking for patients who have noticed a decline in their memory or understanding after being diagnosed with Parkinson's disease. We are doing this research study to find out if the drug SYN120 can be safely given to patients with Parkinson's disease dementia (PDD) and to see if SYN120 helps to improve your ability to think, understand, learn, and recall.

### **Do you qualify for the study?**

- Have you been diagnosed with Parkinson's disease?
- Are you 50 years of age or older?
- Do you have contact with a caregiver at least 3 days week?
- Have you been diagnosed with probable Parkinson's disease dementia (PDD)?
- Are you on a stable regimen of a cholinesterase inhibitor (Exelon®, Aricept®, or Reminyl®)?

If you answered yes to all of these questions you may be a good candidate and should call the number listed below if you would like to learn more.

### **What is involved if I participate?**

Volunteers will be in this study for 6 months and visit the clinic 6 times. If you volunteer you will be randomized to either SYN120 (active drug) or a placebo (an inactive drug). You have an equal chance of receiving the study drug or the placebo.

**If you are interested in participating or want to learn more,
